AIR CONTRAST UPPER GASTROINTESTINAL EXAM

Clinical History: Evaluate for peptic ulcer disease.**Comparison:** None.**Findings:**

Air contrast gastrointestinal examination procedure was performed per protocol. Visualized esophagus and gastric region demonstrates no stricture, mucosal/submucosal abnormality or mass lesion. There was no ulceration involving the esophagus or gastric region. The esophagus and gastric region, both demonstrated normal caliber and distension without displacement. Esophageal and gastric peristalsis appears within normal limits.

There is a 5 mm diameter, mucosal/submucosal ulceration involving the anterior aspect of the duodenal bulb . Surrounding adjacent mucosal edema is seen to a mild extent in the region of the ulceration. Ulceration demonstrates a smooth contour without irregularity or associated mass. Duodenal peristalsis appeared overall slightly impaired. Duodenum demonstrate normal caliber without displacement.

Impression:

5 mm mucosal/submucosal ulceration involving the anterior wall of the duodenal bulb with adjacent mild edema. Consider follow-up endoscopy to evaluate further as indicated.
