NUCLEAR MEDICINE -TOTAL BODY RADIONUCLIDE BONE SCAN

**Clinical History:** Evaluate for metastatic disease with history of prostate cancer.**Comparison:** None.**Findings:**

Following intravenous administration of Technetium-99m-MDP, multiple whole body planar images were obtained.

There are focal areas of intense abnormal increased activity seen involving the right proximal humeral shaft, the left sixth rib anteriorly and the right iliac crest of the pelvis.

Visualized kidneys and urinary bladder demonstrate no significant scintigraphic abnormality.

**Impression:** Findings further detailed above involving the right humerus, left anterior sixth rib and right iliac crest suspicious for osseous metastatic disease. Correlation with plain film radiographs of these areas is recommended.
